"The nucleotide sequence of the coat protein genes and 3' non-coding regions of two resistence-breaking tobamoviruses in pepper shows that they are different viruses.";
Arch. Virol. 131:75-88(1993).
-!- SIMILARITY: Belongs to the tobamoviruses coat protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contign has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is generally based on at least 8% average coverage in Q20 bases and has been reviewed to rule out gross misssemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads chamistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319

Consensus quality: 171366 bases at least Q20

Consensus quality: 171366 bases at least Q20

Insert size: 171834; sum-of-contigs

Quality coverage: 9.21x in Q20 bases; sum-of-contigs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        *** NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
as soon as it is available and the accession number will
be preserved.

Submitted (31-701.2004) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA.

On Jul 31, 2004 this sequence version replaced gi:48958568.

Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities if the sequence quality does not meet this standard, it will be indicated in the annotation.

family e.g. to the N-terminus of SW:COPA_PSESM
(EMBL:M1930), CopA, Pseudomona syringae copper
resistance protein A precursor (609 aa), fasta scores;
opt: 170 z-score: 188 4 E(): 0.0036, 27.3‡ identity in 205
aa overlap. Also weakly similar to the blood coagulation
factors which are structurally related to the multicopper
oxidases. Similar to the N-terminus of TR:O53858
(EMBL:ALO22004) Mycobacterium tuberculosis hypothetical
protein (504 aa) (25.1‡ identity in 323 aa overlap).
Contains PS00079 Multicopper oxidases signature 1 and
PS00080 Multicopper oxidases signature 2 (the latter
